Making

Crossing the Chasm

What is this talk about? (and what it is not!)

What is this talk about:

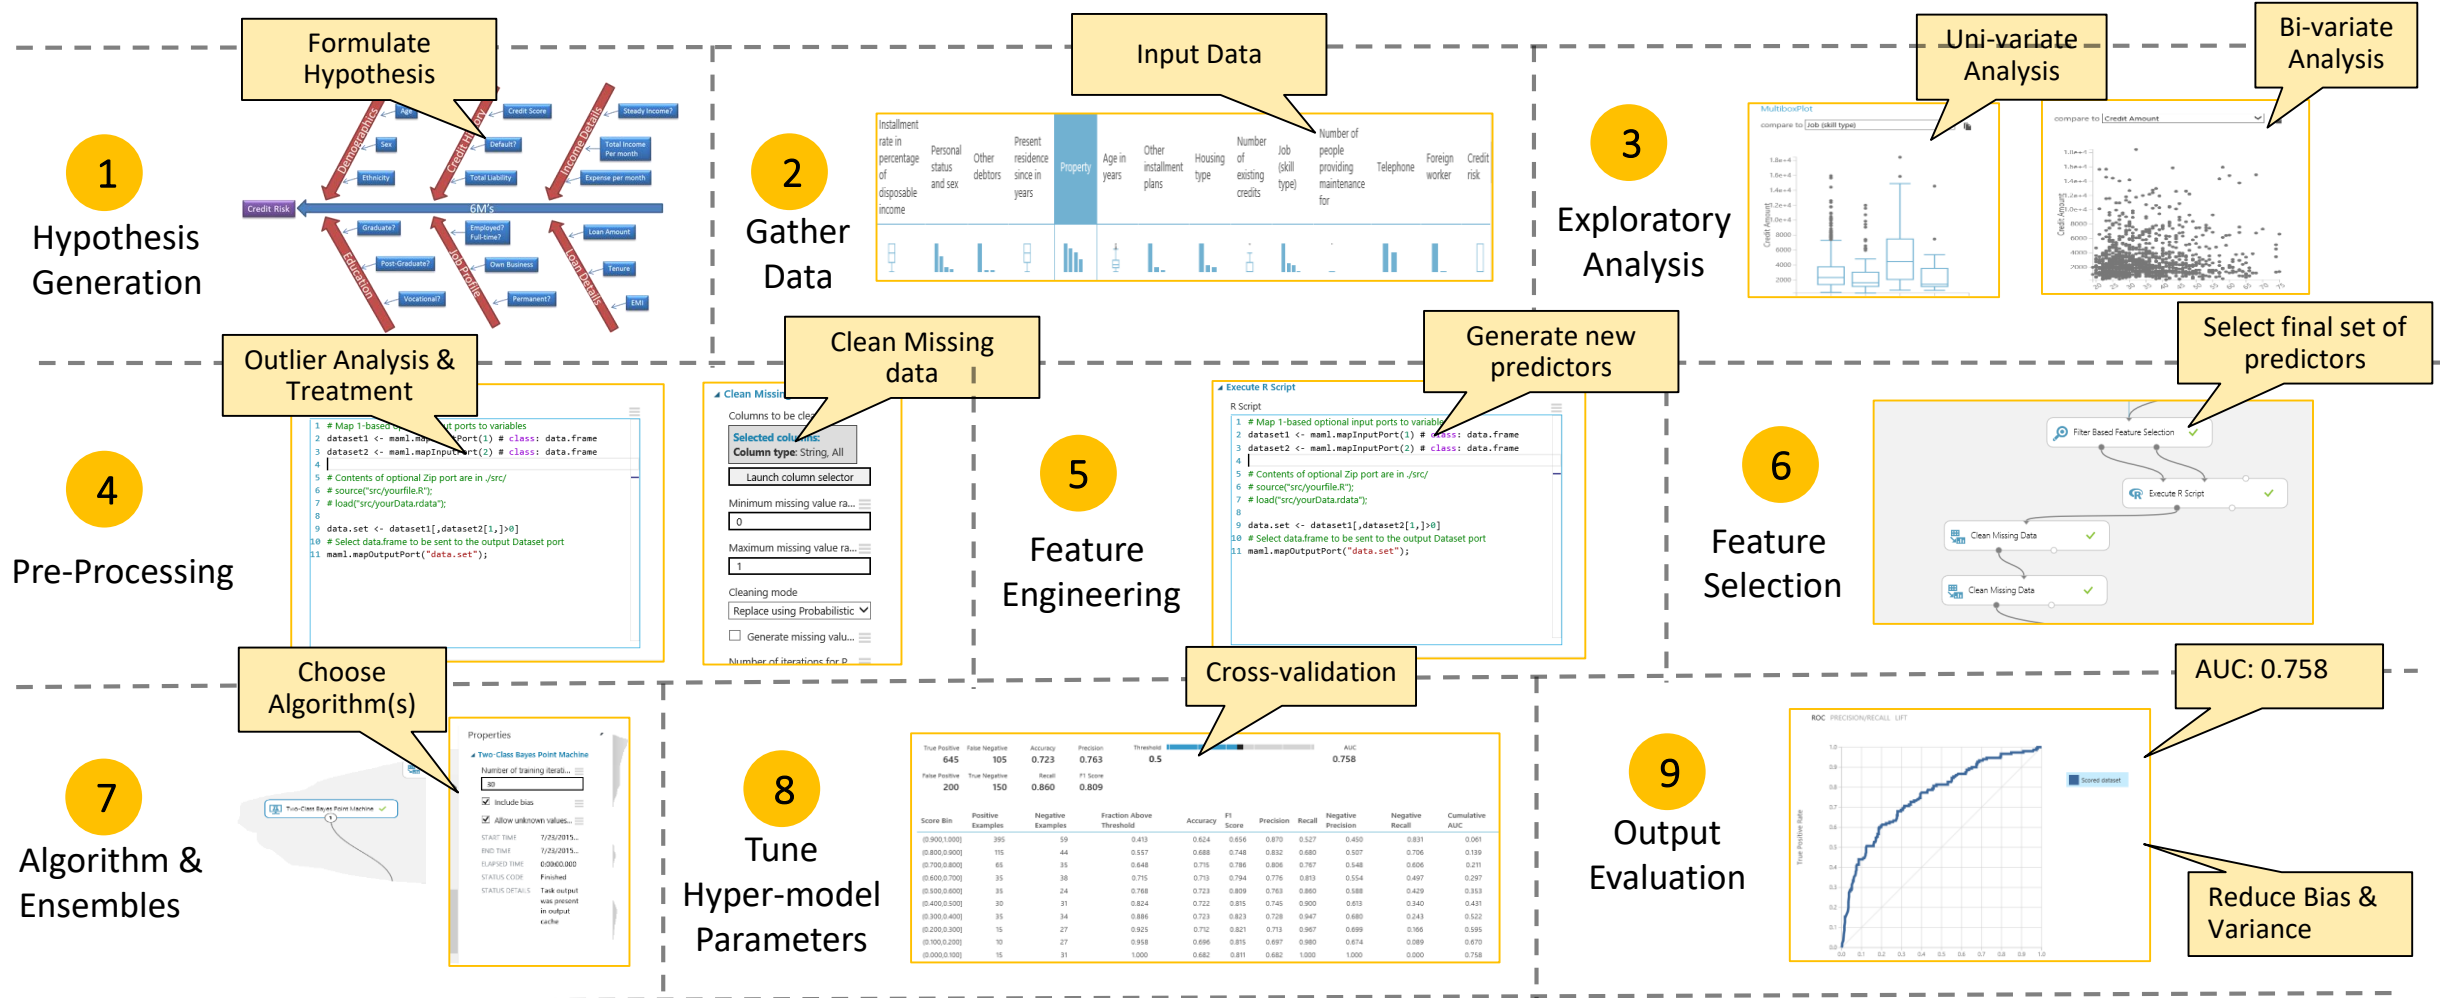

- ML / DL are fascinating and powerful tools...but
- Significant gap exists in utilizing ML / DL predictions for business decision making
- Introduction to Simulation Modeling
- Explore synergies between Simulation Modeling & Data science techniques

What this talk is not:

- Does not cover any specific ML / DL / AI techniques
- Does not cover any math / stats concepts
- Does not cover moral & ethical dimensions of data science / AI

(Classical) Supervised Machine Learning Pipeline

WE ALL LOVE THIS AND IT HAS MANY USE CASES IN THE INDUSTRY ...

'Partying' Data Scientists vs 'So What' Business Guy

Data Scientists

Business Decision Maker

Decision Making 101

Real World (Business)

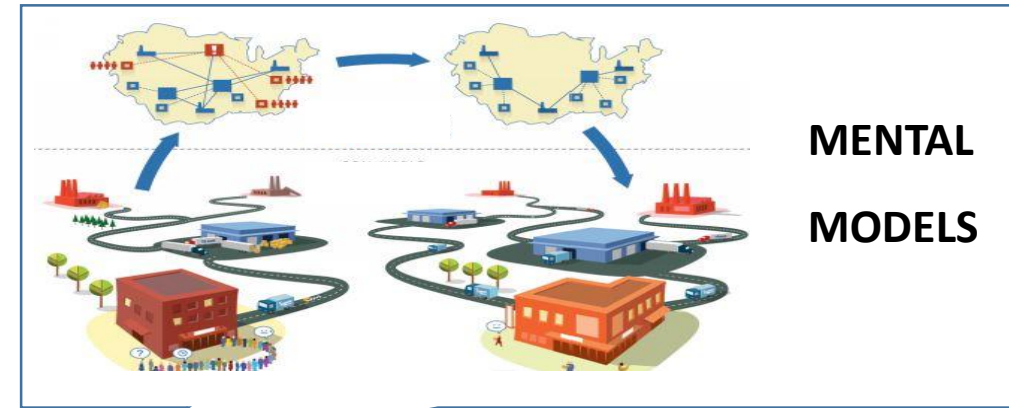

- Multiple Entities
- Complex Non-Linear Relationships
- Delayed Feedback
- 'Black Swan' Events

DECISIONS

EXPERTISE

- ✓ Education
- ✓ Training
- ✓ Experience

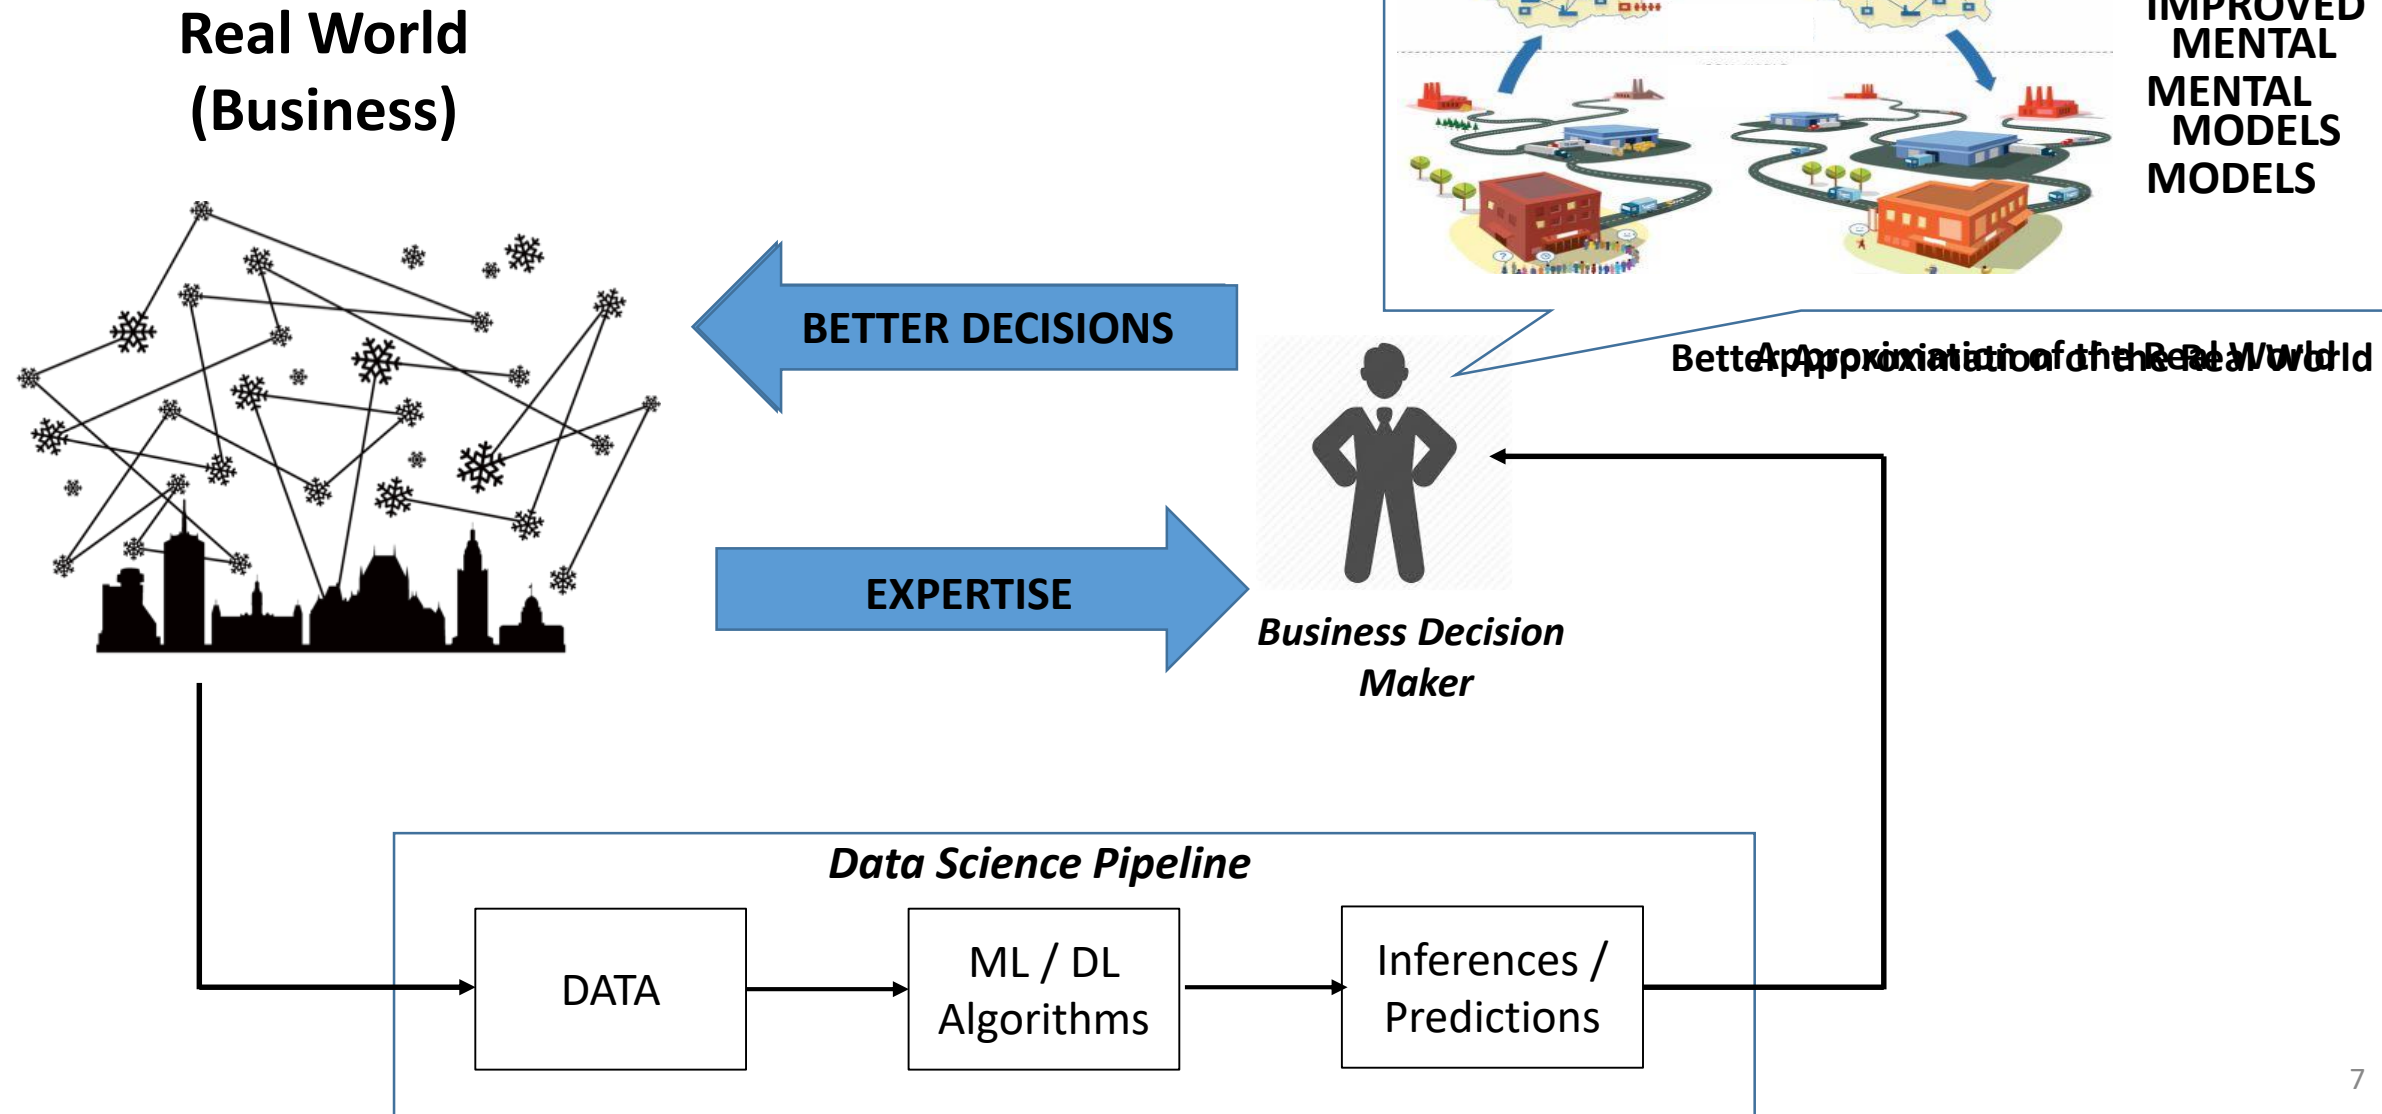

**MENTAL
MODELS**

Approximation of the Real World

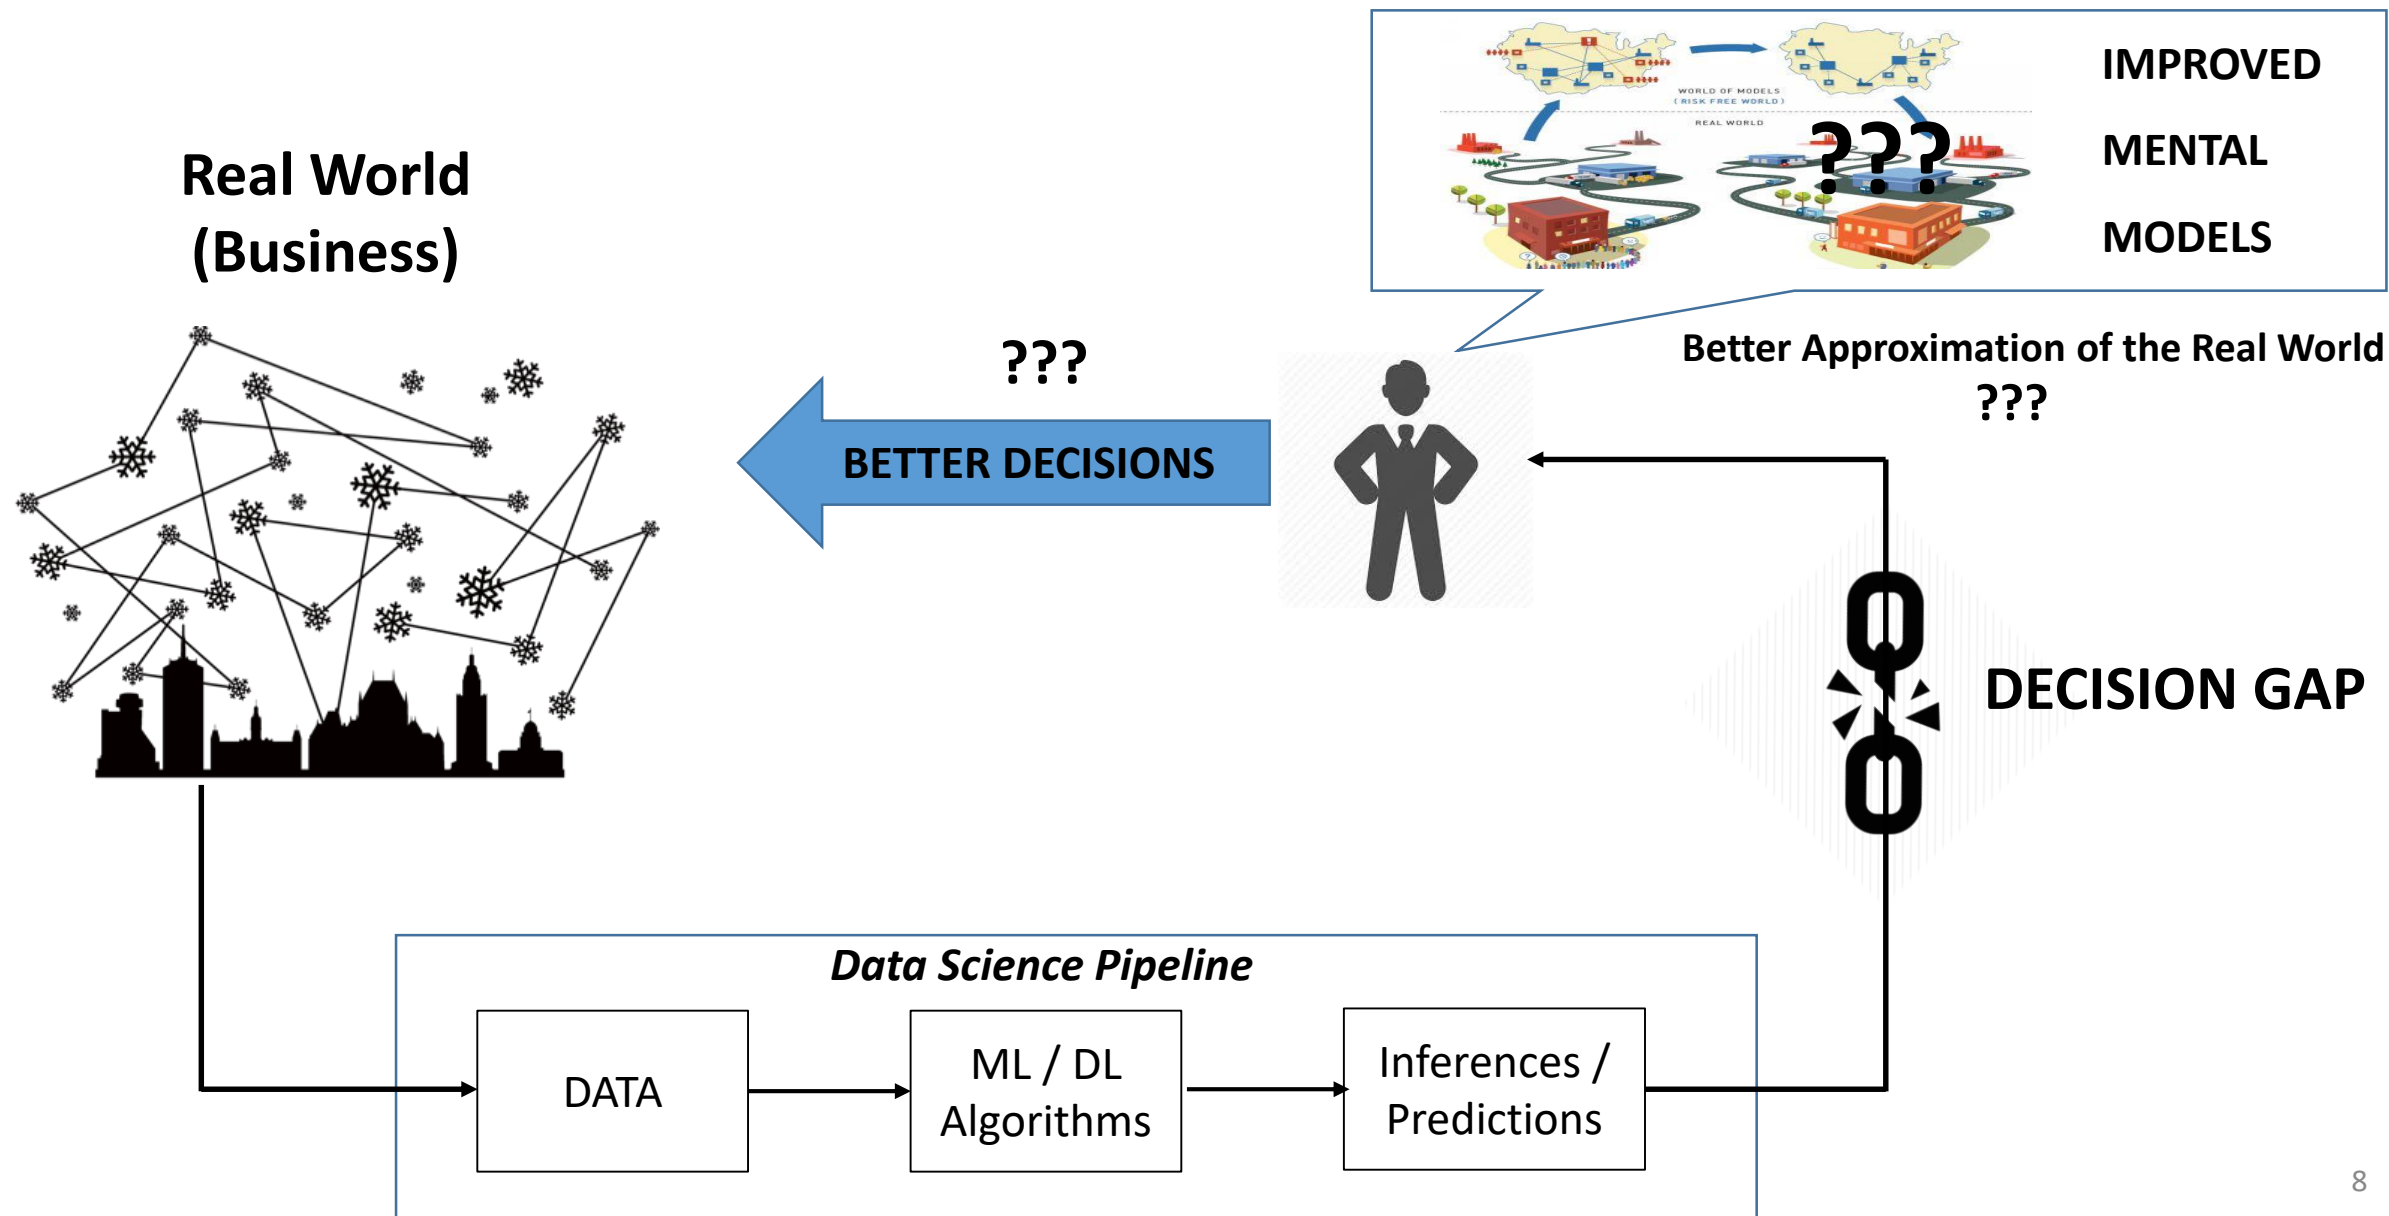

Characteristics of Mental Models

- Process Centric
- Cause & Effect based
- Estimates risk & uncertainty
- Biased
- Rigid (Relatively difficult to change)

Goal of Data Science (ML / DL)

'Decision Gap' – What is it?

The Decision Gap – Why it exists?

Predictions
from
Machine
Learning

1

Black Box Algorithms – Lack of Interpretability of black-box algorithms (GBMs, CNNs etc.) leading to unexplainable predictions at a local level (specific customer or region)

2

No Quantification of Uncertainty – ML models are obtained by minimizing a cost function or by maximum likelihood which results in point estimates with no quantification of uncertainty

3

Lack of Cause & Effect Relationships - ML models are based on correlations in data and does not provide “cause & effect” relationships. Business decisions are about making ‘interventions’ and that requires an understanding of causation

4

No explicit formulation of constraints - Business decision making is always under constraints (time, resources etc.). ML models does not typically take these constraints into account

5

Does not account for Dynamic, Non-linear Interactions - Hey, what do I do with predicted numbers when the business is dynamic, has multiple entities with non-linear interactions?

Business
Decision
Making

Data Science Approach – To Bridge the Decision Gap

Predictions
from
Machine
Learning

1

Machine Learning Interpretability (MLI) – Techniques (LIME, Shapley values etc.) that deal with explains predictions at a local / individual record level

2

Probabilistic Programming – Techniques that leverage Bayesian Inference to provide distribution of parameter values (not point estimates) thus quantifying uncertainty

3

Causal Machine Learning – Techniques like Bayes Nets, Structural Equation Models (SEM) etc. that helps determine causal interaction among variables with ability to represent complex interactions in a manageable compact form

4

Optimization – Well understood area with techniques like linear programming to help maximize or minimize objective functions along with decision variables and related constraints

5

Reinforcement Learning – Techniques that helps in finding optimal policies in an environment through Dynamic Programming, Q-Learning etc. But still very much restricted to “Grid Worlds” and not widely adopted in business setting

Business
Decision
Making

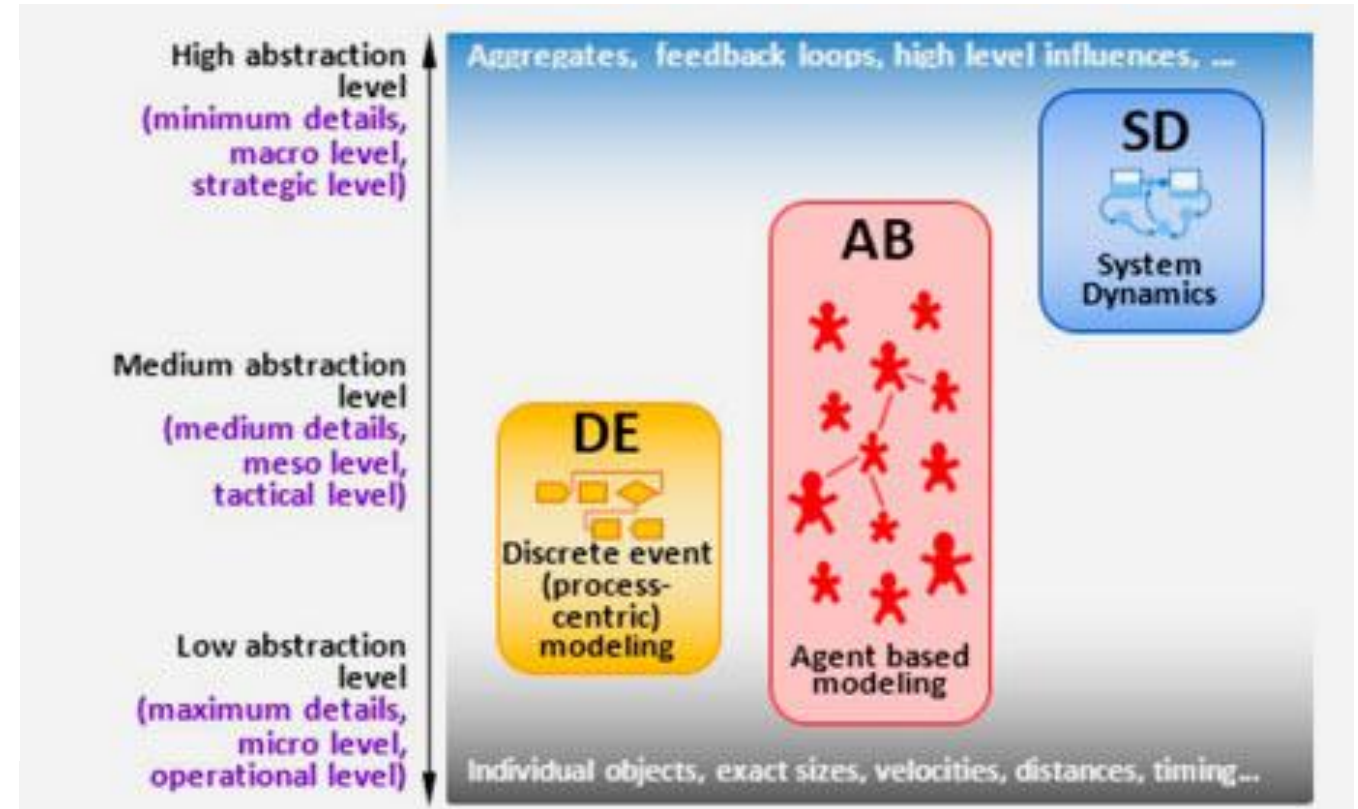

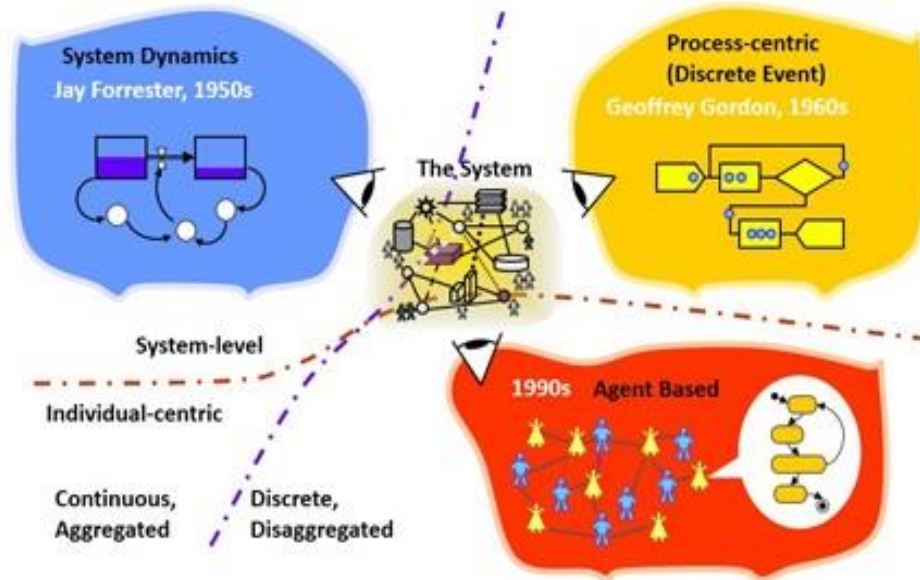

ENTER THE WORLD OF SIMULATION MODELING

What is Simulation Modeling?

Simulation Modeling (or Business Simulations) helps build realistic approximations of the real world and factors in business complexity

What is AnyLogic?

Techniques for Simulation Modeling

Many Tools: AnyLogic, Vensim, Stella, Simio, Arena, Flexsim, Netlogo etc.

Data Science + Simulation Modeling – A Powerful Combination

Simulation Modeling

Data Science (ML / DL / AI)

1

Simulations are created based on the expert view on process relationships between entities
– Could be unknown / biased / not realistic

Data Science by utilizing real world data and machine learning techniques can help correct the bias, increase precision, provide insights

Python
Package
PySD

2

Simulations can help generate good quality data from a representative model of the real world under different situations

Supervised Machine Learning needs good quality labelled data to generate reliable predictions

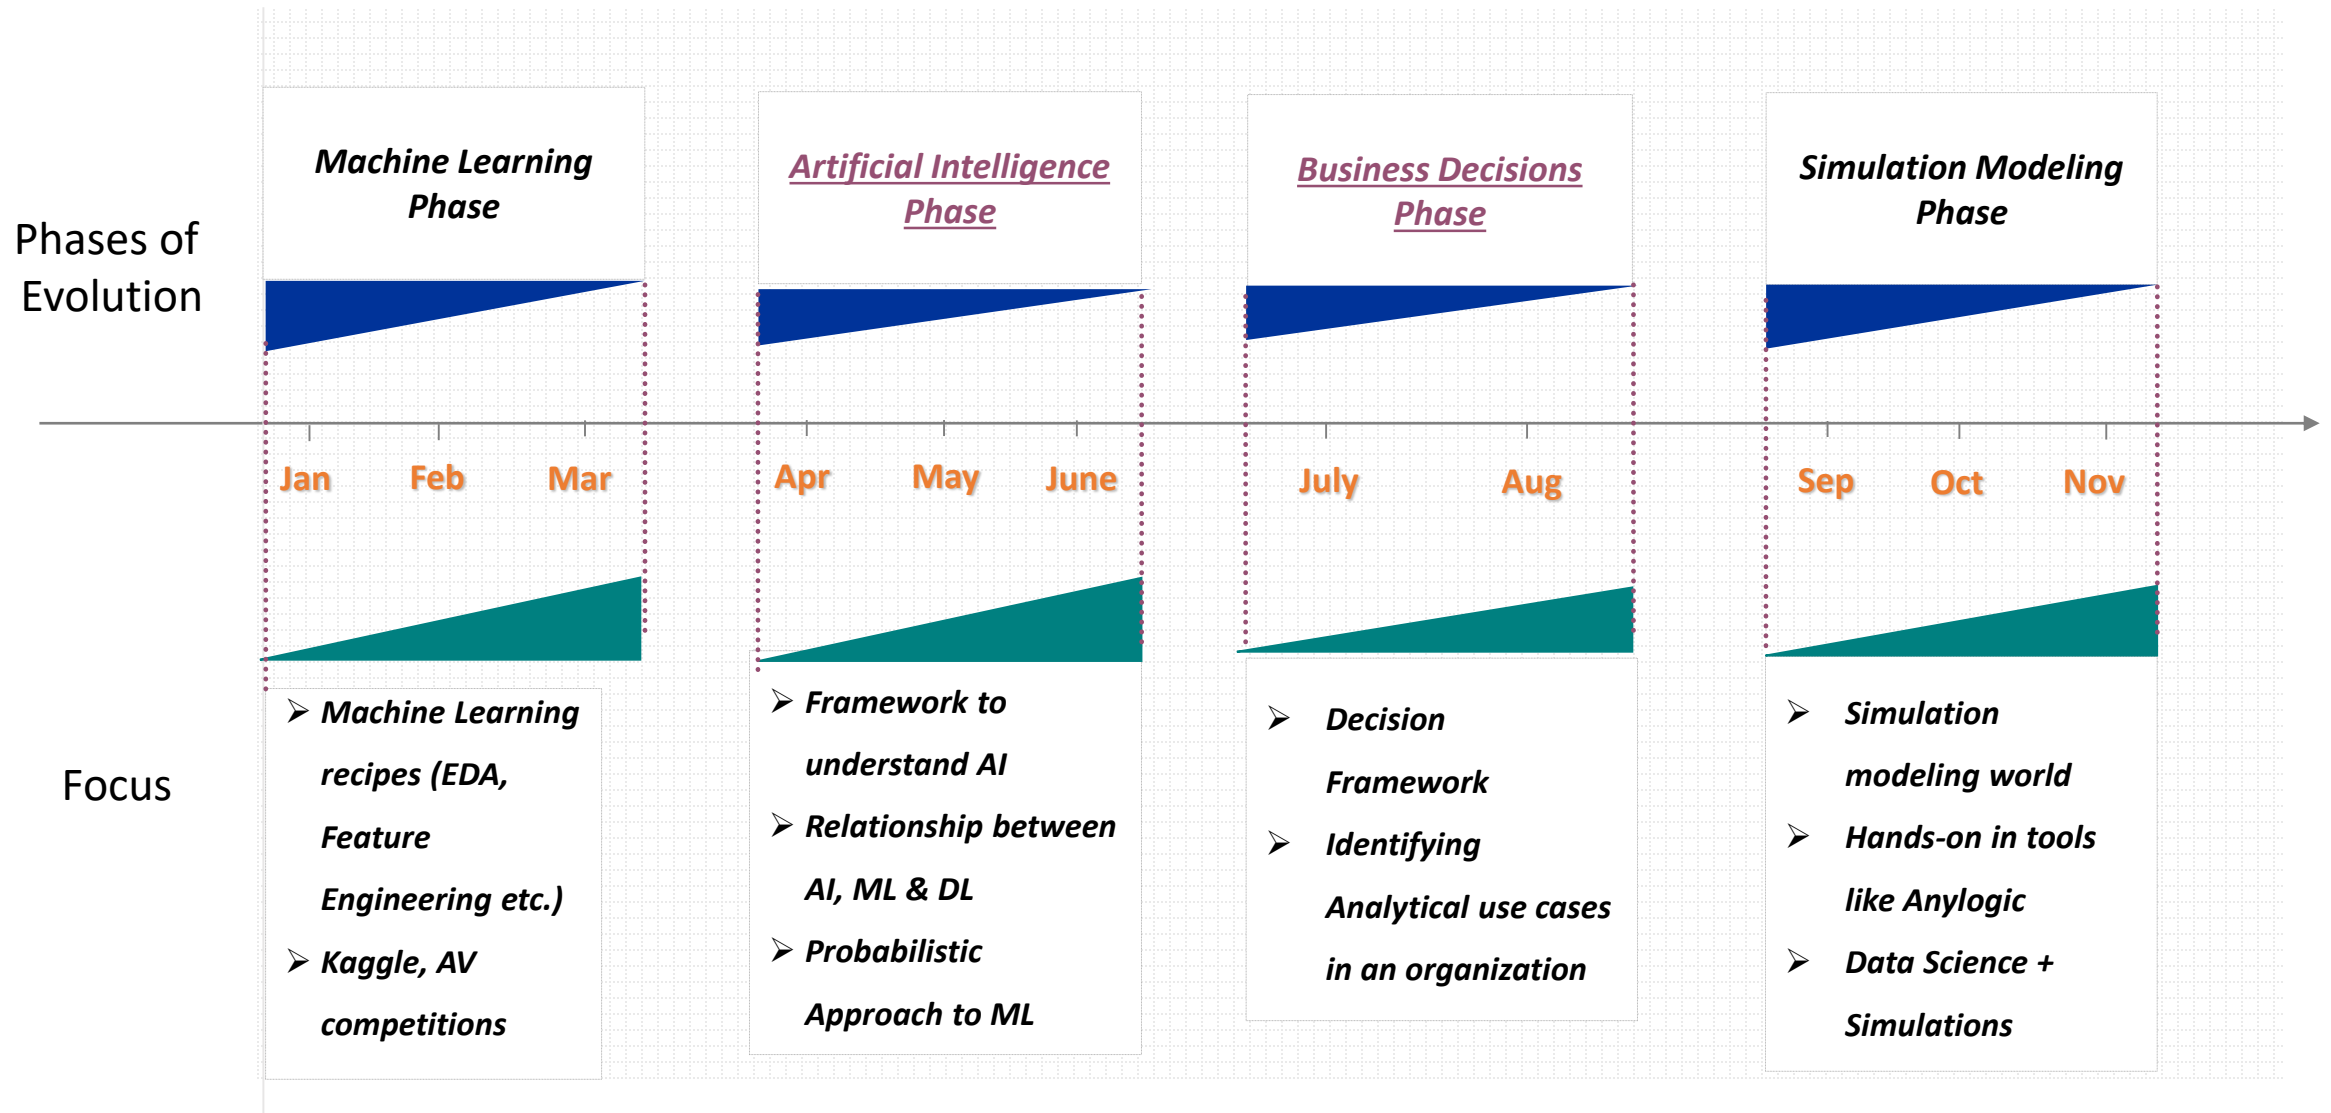

3

Simulation models can provide the environment in which agents can operate across multiple runs to learn the policy

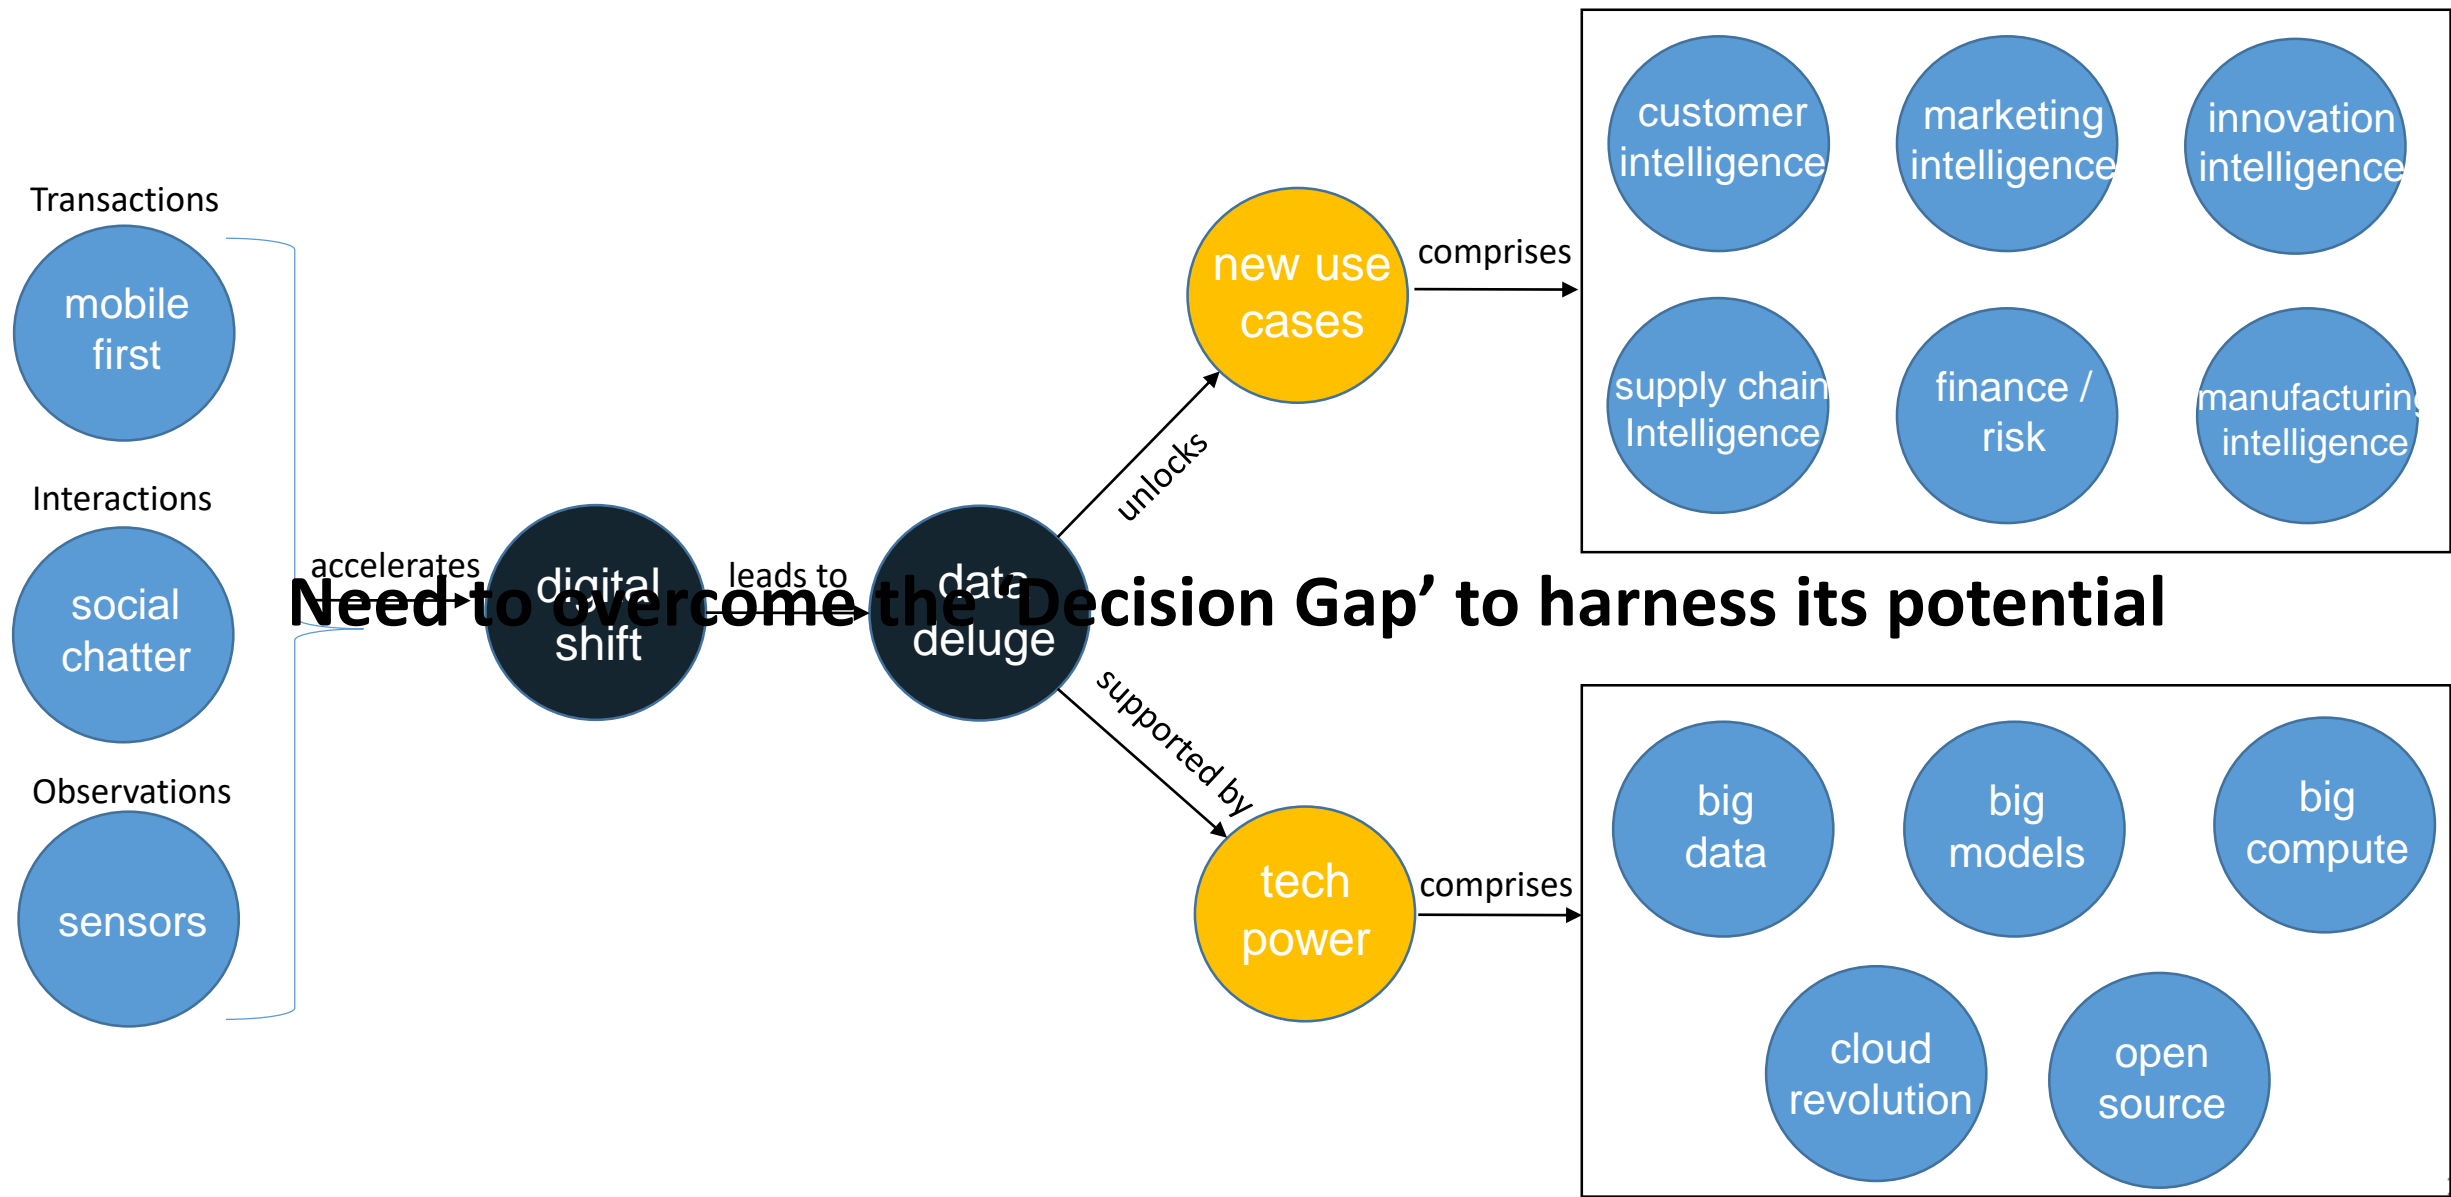

In Reinforcement Learning actions have to be performed in an environment multiple times to derive the appropriate policy (Q values)

My personal 'Data Science' journey this year

Data Science & Analytics – ‘Clear & Present’ Opportunity

Artificial Intelligence and Human Intelligence

Artificial Intelligence refers to the theory and development of computer systems & machines with the ability to perform tasks normally requiring human intelligence

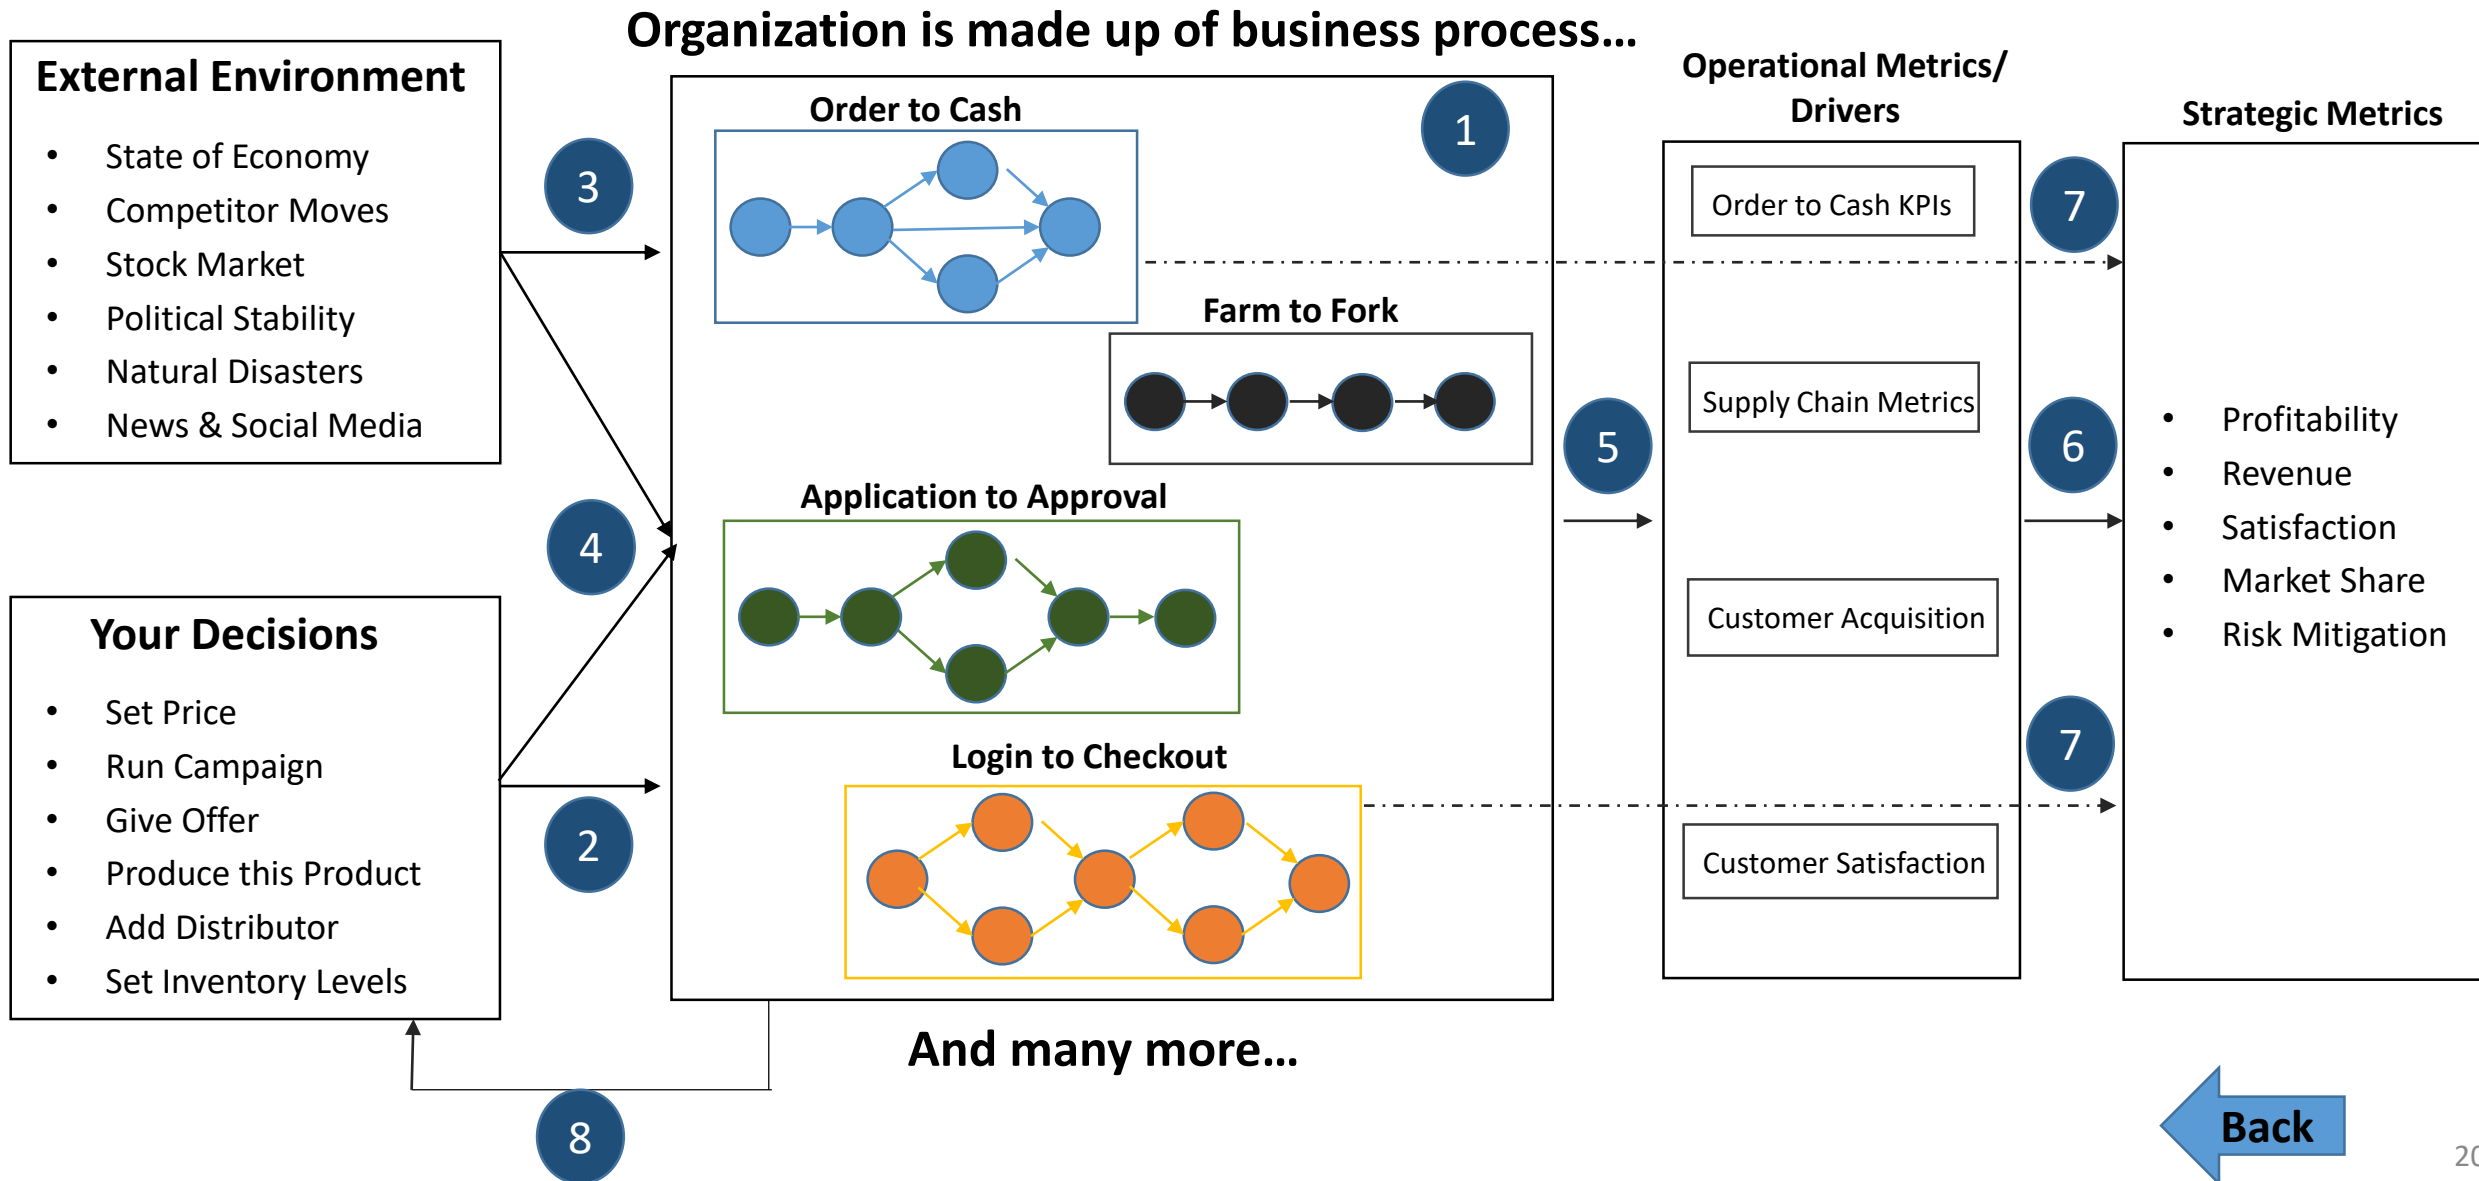

1. Perceive the world, detect signals and collect data
2. Make sense of the world using data (Insights, Inference, Predictions etc.)
3. Decide on the next course of action
4. Act in the Real World

AI Techniques in Enterprises – Parallels to Human Intelligence

Business Decision Making Framework

My Analytics Mindmap

- Global Trends in Society
- Macro-economy
- Business Fundamentals
- Specific Industry Domain
- Analytical use cases

Analytics for Business Value
<http://bit.ly/31KArT8>

- Data Management
- Reporting & Self-service
- Quantitative Techniques
- Performance Mgmt
- Insight Delivery

- Scan for New Products
- Evaluate Maturity

- Monitor Ecosystem
- Leverage Resources

Thank You
